ABSTRACT

The report presents statistics on the characteristics of households and families in the United States, derived from the March 1976 Current Population Survey conducted by the Bureau of the Census. New features include characteristics of Spanish origin households; whether homes are owned or rented; and whether homes are located in single or multi-unit structures. The survey indicates that more than half of all households in the country contain only one or two persons. This could be a result of low fertility, postponement of marriage, the ability of young singles and the elderly to finance and maintain their own households, or marital dissolution. Despite increases in the rate of separation and divorce and the increasing tendency for young adults to establish their own nonfamily households, married couples still maintain nearly two-thirds of all households. Although it may be more difficult for young people to afford housing, this difficulty is not reflected by a decline in their level of homeownership. Black households are more likely to be residents of multi-unit housing than white households. During the current decade, the number of families headed by women who reported no husband present has increased by one-third. Most of the document contains tables of data illustrating these trends. HOUSEHOLD AND FAMILY CHARACTERISTICS: MARCH 1976

INTRODUCTION AND HIGHLIGHTS

Every society organizes itself into a system of living arrangements of varying complexity. In the United States, as in most countries, the basic units for this system are households and families.

The number of members and their familial relationships, if any, are not only major determinants of the lifestyle of the people residing in each unit, but also have an impact on the style of life enjoyed by the population in general. For example, the experience of living in a six-member household comprised of a married couple and their four young children will differ markedly from one where the sole occupant is an aged widow. The number and composition of these units will, in turn, have a substantial impact on the level of demand for a vast array of products and services including housing, education, and health care.

This report presents detailed statistics on the characteristics of households and families in the United States. The report contains several new features heretofore not presented on an annual basis including characteristics of Spanish origin households and families, whether homes are owned or rented, and whether homes are located in single or multi-unit structures. Highlights of the major items presented in the text of this report are as follows:

- More than half of all households in the country contain only one or two persons. Low fertility, postponement of marriage, the formation of households by those born during the baby boom, the ability of young singles and the elderly to finance and maintain their own households, and marital dissolution are all contributors to the increase in households containing no more than two people.

- Despite increases in the rate of separation and divorce and the increasing tendency for young adults to establish their own nonfamily households, married couples still maintain nearly two-thirds of all households.

- Although it may be getting more difficult for young people to afford the housing that is available, this difficulty is not reflected by a decline in their level of homeownership.

- Black households were more likely to be residents of multi-unit housing than White households.

- In 1976 just over one-quarter of all families had at least one adolescent aged 12 to 17 living at home.

- During the current decade, the number of families headed by women who reported no husband present has increased by one-third.

The data presented in this report were derived from the March 1976 Current Population Survey (CPS) conducted by the Bureau of the Census and are subject to sampling variability, which may be relatively large for the smaller figures and for small differences between figures. For a further discussion of sampling variability see the section on "Reliability of the Estimates" in the Appendix.

CHANGES IN THE SIZE OF THE AMERICAN HOUSEHOLD

Since 1960 the number of households has grown by about 20.1 million, an increase of 38 percent. Most of this growth has been concentrated among households occupied by persons living alone or with no more than one other person. Indeed, there were more than twice as many one-person households in 1976 as in 1960, while households with two persons increased by about one-half during this period. Households with three or more persons, however, increased by only about one-seventh (table A).

These changes have had a predictable impact on the mix of households by size. The share of all households occupied by people living alone has increased from 13.1 to 20.6 percent since 1960.

The only other size category which accounts for a larger share of all households in 1976 than in 1960 is the two-person household which has increased slightly from 27.8 to 30.6 percent of the total. Thus, one- and two-person households now constitute more than half of all households in the country.

At the other end of the size spectrum, we find that households with six or more members are even less common today than was the case at the beginning of the 1960's. Whereas 11 of every 100 households had at least six members in 1960, there were only about 7 such units per 100 households in 1976.

The trend toward smaller households results from the interplay of a variety of factors. Low fertility, postponement of marriage, the formation of new, small households by those born during the baby boom, the ability of young singles and the elderly to finance and maintain their own households, and marital dissolution are all likely contributors to the proliferation of American households consisting of only one or two persons.

CHANGES IN THE MIX OF HOUSEHOLD TYPES

Despite such factors as the recent increase in the rate of marital dissolution and the increasing tendency for young adults to establish their own nonfamily households, the husband-wife household continues to be the dominant living arrangement in the United States. Nationwide, about two of every three households (65 percent) were maintained by a married couple in 1976 (table B). The husband-wife household, however, accounted for a smaller overall share of American households in 1976 than in 1970, when they represented 71 percent of the total.

The reduction in the proportion of all households that were maintained by a married couple did not result from an actual decline in their total number. Rather, it has largely been a function of the relatively more rapid increases in other household types. There was an increase of 9.5 million households between 1970 and 1976. About seven of every ten of these additional households consisted either of persons living alone or with nonrelatives only

(i.e., primary individuals), or of women maintaining a family where there was no husband present.

The 9.5 million net increase in households since 1970 represents an increase of 15 percent. During the same period, households of primary individuals increased by 41 percent, a higher rate of increase than was exhibited for any other household type. As a consequence of these differential rates of change, primary individual households accounted for 23 percent of all households in 1976, compared with 19 percent in 1970.

The shift in the composition of the household mix is apparent in both metropolitan and nonmetropolitan areas. Between 1970 and 1976, however, a greater proportion of the total household increase outside metropolitan areas than in such areas occurred among husband-wife households. Approximately half (49 percent) of the 3.7 million nonmetropolitan households added since 1970 were maintained by married couples. By way of contrast, only about 13 percent of the 5.8 million metropolitan households added during the period were maintained by married couples.

Female	3,081	13.3	2,286	11.7	795	34.8	21.6

Households maintained by women living with relatives other than their husbands increased by one-third nationally between 1970 and 1976. This type of household accounted for a larger share of the total increase in metropolitan areas (24 percent) than in nonmetropolitan areas (12 percent).

Information is also available concerning changes in White households and Black households. In 1970, about half (53 percent) of all Black households were maintained by a married couple (table C). The figure dropped to 45 percent in 1976. During the same period, the corresponding proportion for White households declined from 73 to 67 percent. Almost half (48 percent) of the 1.3 million increase since 1970 in the number of Black households is attributable to additional family households maintained by women with no husband present. In contrast, only 15 percent of the 7.8 million increase in White households between 1970 and 1976 was accounted for by households maintained by women living with relatives other than their husband.

There were about 3 million households in 1976 that were maintained by persons of Spanish origin. Eighty-four percent of these units were families, and 16 percent were primary individuals of Spanish origin.

DIFFERENCES IN THE LEVEL OF HOMEOWNERSHIP

The 1976 data indicated that close to two-thirds of all household heads owned or were in the process of buying the home in which they lived (table D). Homeownership tended to be most common among husband-wife households. Three of every four homeowner households (76 percent) were husband-wife households, and three of every four husband-wife households (76 percent) were owners.

Other types of households were somewhat less likely to own their living quarters. For example, about one-third (32 percent) of male primary individuals were owners of the units in which they lived.

Household heads who had entered their middle years (those 35 to 64 years of age) but had not yet reached retirement age were more frequently owners than either their more youthful or older counterparts. About 75 percent of all homes of persons 35 to 64 years of age were owned. The corresponding figure for household heads under 35 was 44 percent.

[1] 1970 Census of Population, Subject Reports, PC(2)-4A, "Family Composition."

About 71 percent of household heads age 65 and over were owners. Although this is not a substantially lower level of ownership than that found in the intermediate age category, it may reflect some tendency among husbands and wives approaching, or already beyond, retirement age to move from homes which they owned into rented or other quarters.

In other than husband-wife households, the level of ownership was highest among those in which the head was 65 years old or older. For example, in family households maintained by women with no husband present, the level of ownership was 77 percent when the woman was age 65 or over, but only 57 percent when she was 35 to 64.

Most primary individuals, particularly those under age 35, were renters. About one-third (32 percent) of all male primary individuals were owners, as compared with only 18 percent of those under 35. The impact of the age differential was even more pronounced among females. Although about half (48 percent) of all female primary individuals owned their living quarters, about one of ten (11 percent) of those under age 35 were owners.

It has been suggested by various housing analysts that it is becoming more difficult, particularly for young adults, to purchase a home. This assertion may be true in terms of the disparity between income and the cost and supply of housing. Nevertheless, between 1970 and 1976 the level of homeownership, as measured by the percentage of

all households that are owned, has either increased or remained unchanged for virtually every type of household regardless of the age of the head of the household.

In 1970 about 50 percent of the youthful husband-wife households (i.e., where the husband was under age 35) owned the dwelling in which they resided. By 1976 the proportion of such households that owned their homes had increased to 57 percent. Although it may be getting more difficult for young people to afford the housing that is available, this difficulty is not reflected by a decline in the level of homeownership.

HOUSEHOLDS IN SINGLE–UNIT AND MULTI–UNIT STRUCTURES

In 1976 about 73 percent of all households occupied single-unit houses, 17 percent were in multi-unit housing of from 2 to 9 units, and the remaining 10 percent were in structures comprised of at least 10 units (table E).

A very high proportion (94 percent) of households in owner-occupied units resided in single-unit housing. By contrast, only about one-third of renters were living in single-unit structures.

Few homeowners (1 percent) were residents of structures with 10 or more units. Presumably, these households are occupants of cooperative housing, condominium developments, and the like. Conversely, a relatively high proportion of renter households (26 percent) were in structures with at least 10 units.

Black households were more often found to be residents of multi-unit housing than White households. About 16 percent of Black households lived in structures with at least 10 units, whereas the corresponding figure for Whites was 9 percent. Seventy-five percent of all White households, and 57 percent of all Black households, were in single-unit housing.

Persons living alone or with nonrelatives only were more likely than family households to live in multi-unit housing. This relationship was true both for those in renter- and owner-occupied units.

PRESENCE OF CHILDREN 12 TO 17

In 1976 about 27 percent of all families had one or more adolescents present in the home. Adolescents are defined here as children 12 to 17 years of age. The 23.5 million adolescents who were living with one or both parents were distributed among 15.1 million families. Less than half of these families had as many as two such children in the home (table F).

Not surprisingly, these children were most frequently found to be living in homes where the person or one of the persons maintaining the family was in his/her middle years (aged 35 to 44). About 61 percent of these families contained one or more own children age 12 to 17.

Clearly, most of the families maintained by persons under 35 did not yet have a child who had reached age 12, and by the time the parent or parents reached age 45 most of their children were likely to be over age 17.

Overall, 74 percent of all White families contained no adolescents. The corresponding figure for Black families was 68 percent. The difference in the proportion of White and Black families with an own child 12 to 17 years old present was greatest for young families (where a parent was under age 35). Among these families, 7 percent of the White families included at least one such child, whereas the corresponding figure for Black families was 18 percent.

INCREASE IN FAMILIES MAINTAINED BY WOMEN WITH NO HUSBAND PRESENT

During the current decade, the number of families headed by women who reported no husband present has increased by one-third (table G), from 5.6 million in 1970 to 7.5 million in 1976. In some cases the woman maintaining the family had never been married. In other instances the husband was absent because of such reasons as separation, divorce, or death.

About 7 of every 10 of these families were maintained by White women, but the families of these White women represented only 11 percent of all White families. By way of comparison, Black women and women of Spanish origin maintained 27 percent and 7 percent respectively of all families headed by women, whereas 36 percent of all Black families and 21 percent of all Spanish origin families were headed by women (with no husband present).

Women who maintained families in 1976 were generally younger than their 1970 counterparts. Between 1970 and 1976, the median age of women with families to maintain declined from 48.2 years to 42.7 years. The median age declined by almost 6 years for Whites, about 3 years for Blacks (the apparent decline shown for Spanish origin women is not statistically significant). Nevertheless, the Black and Spanish origin women were, on the average, about 7 years younger in 1976 than their White counterparts.

[1] Persons of Spanish origin may be of any race.

Overall, there was an 84 percent increase during the period 1970 to 1976 in the number of women under 35 who were family heads. This large increase is not attributable as much to changes in the overall age structure of the population as to other factors. For example, the total number of women 14 to 34 years old increased by 17 percent between 1970 and 1976 while the number of women in this age range maintaining families (with no husband present) increased by 84 percent. Among the other factors are the increasing postponement of marriage and the increase in separation and divorce, coupled with lower birth rates, more employment of women, and a reasonably sufficient housing supply.

RELATED REPORTS

Data for 1976 and earlier years on households and families by type were published in Series P-20, No. 296. Results of a study on the marital history of men and women are provided in Series P-20, No. 297, "Number, Timing, and Duration of Marriages and Divorces in the United States: June 1975." Statistics on the characteristics of female family heads and the members of their families for 1973 and earlier years are presented in Series P-23, No. 50, "Female Family Heads."

Figures for 1976 on age of head and wife for the several types of family units were issued in Series P-20, No. 306, "Marital Status and Living Arrangements: March 1976." Figures on projections for the United States of the number of households and families from 1975 to 1990 have been published in Series P-25, No. 607. Additional statistics for years since 1947 on subjects covered in this report have been published by the Bureau of the Census in other Series P-20 reports.

Statistics on households, families, and related subjects for 1970 for standard metropolitan statistical areas, counties, urbanized areas, cities, States, regions, and the United States are presented in **1970 Census of Population**, Volume I, **Characteristics of the Population**, chapters B, C, and D. Detailed statistics on households and families by age of head for 1970 for States and for large counties and standard metropolitan statistical areas are available in Volume I, chapter D, "Detailed Characteristics." Similar data for the United States and regions, for 1960, have been published in **1960 Census of Population**, Volume I, **Characteristics of the Population**, Part 1, **United States Summary**. Series PC(2)-4A, **Family Composition**, presents 1970 census statistics on size and composition of families, number of own children, and family income. These data are cross-classified by such characteristics of the head as age, race, sex, educational attainment, occupation, and income. Area detail is presented for the United States, urbanized areas, and regions. Census statistics on family members by many of these characteristics are shown in Series PC(2)-4B, **Persons by Family Characteristics**.

NOTE

In the past the Census Bureau has designated a head of household to serve as the central reference person for the collection and tabulation of data for individual members of the household (or family). However, recent social changes have resulted in a trend toward more equal status for all members of the household (or family), making the term "head" less relevant in the analysis of household and family data. As a result, the Bureau is currently developing new techniques of enumeration and data presentation which will eliminate the concept of "head." While much of the data in this report are based on the concept of "head," methodology for future Census Bureau reports will reflect a gradual movement away from this traditional practice.

Table 1. CHARACTERISTICS OF FAMILIES BY TYPE AND RACE AND SPANISH ORIGIN OF HEAD, BY FARM AND NONFARM RESIDENCE: MARCH 1976

(Numbers in thousands. This report excludes inmates of institutions. It includes 914,000 members of the Armed Forces in 1976 who were living off post or with their families on post but excludes all other members of the Armed Forces. For meaning of symbols, see text)

NOTE: CHARACTERISTICS ARE SHOWN FOR HUSBANDS IN HUSBAND-WIFE FAMILIES AND FOR HEADS IN OTHER FAMILIES.

APPENDIX

DEFINITIONS AND EXPLANATIONS

Coverage. The population in this report includes the civilian noninstitutional population of the United States plus approximately 914,000 members of the Armed Forces in the United States living off post or with their families on post in 1976, but excludes all other members of the Armed Forces.

Symbols. A dash "—" represents zero, and the symbol "Z" indicates that the figure is less than 0.05 percent. The symbol "B" means that the base for the derived figure is less than 75,000. An "X" means not applicable, and "NA" means not available.

Rounding of estimates. Individual figures are rounded to the nearest thousand without being adjusted to group totals, which are independently rounded; percentages are based on the unrounded numbers.

Farm-nonfarm residence. The farm population refers to rural residents living on farms. The method of determining farm-nonfarm residence in the present survey and in the Current Population Surveys since March 1960 is the same as that used in the 1960 and 1970 censuses but differs from that used in earlier surveys and censuses. Since March 1960 in the Current Population Surveys, farm residence has been determined by the responses to two questions. Owners are asked "Does this place have 10 or more acres?" and renters are asked "Does the place you rent have 10 or more acres?" If the response is "Yes," the respondent is asked "During the past 12 months, did sales of crops, livestock, and other farm products from this place amount to $50 or more?" If the acreage response is "No," the inquiry relates to sales of $250 or more. Rural persons in motels and tourist camps and those living on rented places where no land is used for farming, are not classified as farm population. The nonfarm population, as the term is used here, comprises persons living in urban areas and rural persons not on farms.

Although the method of determining farm-nonfarm residence has not changed since March 1960, the underlying sampling methods and estimation procedures have changed. For a discussion of changes, see **Employment and Earnings**, Volume 18, No. 8, February 1972, pp. 6-9, published by the Bureau of Labor Statistics.

Tenure. A housing unit is "owner occupied" if the owner or co-owner lives in the unit, even if it is mortgaged or not fully paid for. A cooperative or condominium unit is "owner occupied" only if the owner or co-owner lives in it. All other occupied units are classified as "renter occupied," including units rented for cash rent and those occupied without payment of cash rent.

Units in structure. In the determination of the number of units in a structure, all housing units, both occupied and vacant, were counted. The statistics are presented in terms of the number of occupied housing units in structures of specified size, not in terms of the number of residential structures.

Marital status. The marital status classification identifies four major categories: single, married, widowed, and divorced. These terms refer to the marital status at the time of the enumeration.

The category "married" is further divided into "married, spouse present," "separated," and "other married, spouse absent." A person was classified as "married, spouse present" if the husband or wife was reported as a member of the household, even though he or she may have been temporarily absent on business or on vacation, visiting, in a hospital, etc., at the time of the enumeration. Persons reported as separated included those with legal separations, those living apart with intentions of obtaining a divorce, and other persons permanently or temporarily separated because of marital discord. The group "other married, spouse absent" includes married persons living apart because either the husband or wife was employed, and living at a

considerable distance from home, was serving away from home in the Armed Forces, had moved to another area, or had a different place of residence for any other reason except separation as defined above.

Husband in Armed Forces. When a woman was reported as married but her husband was not enumerated as a member of the same household, an additional question was asked to determine whether her husband was in the Armed Forces. Women who were reported as separated were not asked the additional question.

Household. A household consists of all the persons who occupy a housing unit. A house, an apartment or other group of rooms, or a single room, is regarded as a housing unit when it is occupied or intended for occupancy as separate living quarters; that is, when the occupants do not live and eat with any other persons in the structure and there is either (1) direct access from the outside or through a common hall or (2) a kitchen or cooking equipment for the exclusive use of the occupants.

A household includes the related family members and all the unrelated persons, if any, such as lodgers, foster children, wards, or employees who share the housing unit. A person living alone in a housing unit, or a group of unrelated persons sharing a housing unit as partners, is also counted as a household. The count of households excludes group quarters.

Group quarters. In this report, group quarters include noninstitutional living arrangements for groups containing five or more persons unrelated to the person in charge. Inmates of institutions (starting in 1972) are not included in the Current Population Survey.

Family. The term "family," as used here, refers to a group of two persons or more related by blood, marriage, or adoption and residing together; all such persons are considered as members of one family. A lodger and his wife who are not related to the person or persons who maintain the household, or a resident employee and his wife living in, are considered as a separate family. Thus, a household may contain more than one family. However, if the son of the person or couple who maintains the household and the son's wife are members of the household, they are treated as part of the parent's family. A person maintaining a household alone, or with unrelated persons only, is regarded as a household but not as a family. Thus, some households do not contain a family.

Primary family. A primary family is a family that includes among its members the person or couple who maintains the household.

Secondary family. A secondary family is a family that does not include among its members the person or couple who maintains the household, or any persons related to the person or couple who maintains the household. Members of secondary families may include persons such as guests, lodgers, or resident employees and their relatives living in a household.

Persons living with relatives in group quarters were formerly considered as members of secondary families. However, the number of such families became so small (37,000 in 1967) that beginning with data for 1968 (and beginning with census data for 1960) the Bureau of the Census includes persons in these families in the count of secondary individuals.

Subfamily. A subfamily is a married couple with or without children, or one parent with one or more own single children under 18 years old, living in a household and related to, but not including, the person or couple who maintains the household. The most common example of a subfamily is a young married couple sharing the home of the husband's or wife's parents. Members of a subfamily are also members of a primary family. The number of subfamilies, therefore, is not included in the number of families.

Married couple. A married couple, as defined for census purposes, is a husband and his wife enumerated as members of the same household. The married couple may or may not have children living with them. The expression "husband-wife" before the term "household," "family," or "subfamily" indicates that the household, family, or subfamily is maintained by a husband and wife. Tables which display data for characteristics of the head (e.g., age, sex, race) for households or families show characteristics of the husband in husband-wife households or families.

Unrelated individuals. Unrelated individuals are persons (other than inmates of institutions) who are not living with any relatives. An unrelated individual may be (1) a person living alone or with nonrelatives only, (2) a lodger or resident employee with no relatives in the household, or (3) a group

quarters member who has no relatives living with him. Thus, a widow who occupies her house alone or with one or more other persons not related to her, a roomer not related to anyone else in the housing unit, a maid living as a member of her employer's household but with no relatives in the household, and a resident staff member in a hospital living apart from any relatives are all examples of unrelated individuals.

Primary individual. A primary individual is a person maintaining a household while living alone or with non-relatives only.

Secondary individual. A secondary individual is a person in a household or group quarters such as a guest, lodger, or resident employee (excluding primary individuals and inmates of institutions) who is not related to any other person in the household or group quarters. (See section above on "Secondary family" for slight change in coverage of secondary individuals in 1968.)

Head of household, family, or subfamily. According to current terminology used by the Bureau of the Census, one person in each household, family, or subfamily is designated as the "head." The number of such persons, therefore, is equal to the number of households, families, or subfamilies. This person is usually the person regarded as the head by the members of the group. Married women are not classified thus, if their husbands are living with them at the time of the survey.

The use of the term "head" in Census Bureau enumerations and publications has been criticized by a number of individuals and groups as being offensive, because of its hierarchical connotations, and not descriptive of the responsibility-sharing roles of members of households and families. Historically, the Bureau has primarily used the term "head" as a convenient way of determining relationships within households and families and of defining households and families by the characteristics of a single household member in data tables. These practices are currently being reviewed and efforts are underway to develop a suitable alternative which would be inoffensive and yet allow for the collection and publication of data on household and family characteristics on a basis which would keep the adverse effects on time-series comparisons to a minimum.

Size of household, family, or subfamily. The term "size of household" includes all persons occupying a housing unit. "Size of family" includes persons in the living quarters who are related to each other by blood, marriage, or adoption. "Size of subfamily" includes the husband and wife or the lone parent and their sons and daughters under 18 years of age who constitute a subfamily. If a primary family has a subfamily among its members, the size of the primary family includes the members of the subfamily.

Related persons and family members. In the classification of households by number of related persons, the person or couple who maintains the household or (housing unit) and all persons in the household related to them are included. In the classification of families by number of family members, all persons in the family are included. The number of family members is the same as the size of the family.

Own children and related children. "Own" children in a family are sons and daughters, including stepchildren and adopted children, of the family head. Similarly, "own" children in a subfamily are sons and daughters of the subfamily head. "Related" children in a family include own children and all other children in the household who are related to the family head by blood, marriage, or adoption. All children shown as members of subfamilies are own children of the subfamily head. For each type of family unit identified in the CPS, the count of own children under 18 years old is limited to single (never married) children; however, "own children under 25" and "own children of any age," as the terms are used here, include all children regardless of marital status.

The count of related children in families was formerly restricted to single (never married) children. However, beginning with data for 1968 the Bureau of the Census includes ever-married children under the category of related children. This change added approximately 20,000 children to the category of related children in March 1968.

Years of school completed. In this report, data on years of school completed were derived from the combination of answers to two questions, (a) "What is the highest grade of school that the person has attended?" and (b) "Did the person finish this grade?"

The questions on educational attainment applied only to progress in "regular" schools. Such schools include public, private, and parochial elementary and high schools (both junior and senior high), colleges, universities, and professional schools, whether day schools or night schools. Thus, "regular" schooling is that which advances a person toward an elementary or high school diploma, or a college, university, or professional school degree.

Schooling in other than regular schools was counted only if the credits obtained were regarded as transferable to a school in the regular school system.

Labor force and employment status. The definitions of labor force and employment status in this report related to the population 14 years old and over.

Employed. Employed persons comprise (1) all civilians who, during the specified week, did any work at all as paid employees or in their own business or profession, or on their own farm, or who worked 15 hours or more as unpaid workers on a farm or in a business operated by a member of the family, and (2) all those who were not working but who had jobs or businesses from which they were temporarily absent because of illness, bad weather, vacation, or labor-management dispute, or because they were taking time off for personal reasons, whether or not they were paid by their employers for time off, and whether or not they were seeking other jobs. Excluded from the employed group are persons whose only activity consisted of work around the house (such as own home housework, painting or repairing own home, etc.) or volunteer work for religious, charitable, and similar organizations.

Unemployed. Unemployed persons are those civilians who, during the survey week, had no employment but were available for work and (1) had engaged in any specific jobseeking activity **within the past 4 weeks**, such as registering at a public or private employment office, meeting with prospective employers, checking with friends or relatives, placing or answering advertisements, writing letters of application, or being on a union or professional register; (2) were waiting to be called back to a job from which they had been laid off; or (3) were waiting to report to a new wage or salary job within 30 days.

Labor force. Persons are classified as in the labor force if they were employed as civilians, unemployed, or in the Armed Forces during the survey week. The "civilian labor force" is comprised of all civilians classified as employed or unemployed.

Not in the labor force. All civilians who are not classified as employed or unemployed are defined as "not in the labor force." This group who are neither employed nor seeking work includes persons engaged only in own home housework, attending school, or unable to work because of long-term physical or mental illness; persons who are retired or too old to work, seasonal workers for whom the survey week fell in an off season, and the voluntary idle. Persons doing only unpaid family work (less than 15 hours) are also classified as not in the labor force.

Occupation. The data on occupation of employed persons refer to the civilian job held during the survey week. Persons employed at two or more jobs were reported in the job at which they worked the greatest number of hours during the week.

The occupation groupings used here are mainly the major groups used in the 1970 Census of Population. The composition of these groups is shown in Volume 1, **Characteristics of the Population**, Part 1, **United States Summary**, chapter D. The categories used are either detailed classifications or combinations thereof.

Metropolitan-nonmetropolitan residence. The population residing in standard metropolitan statistical areas (SMSA's) constitutes the metropolitan population. Except in New England, an SMSA is a county or group of contiguous counties which contains at least one city of 50,000 inhabitants or more, or "twin cities" with a combined population of at least 50,000. In addition to the county, or counties, containing such a city or cities, contiguous counties are included in an SMSA if, according to certain criteria, they are essentailly metropolitan in character and are socially and economically integrated with the central city. In New England SMSA's consist of towns and cities, rather than counties. The metropolitan population in this report is based on SMSA's as defined in the 1970 census and does not include any subsequent additions or changes.

Central cities. Each SMSA must include at least one central city, and the complete title of an SMSA identifies the central city or cities. If only one central city is designated, then it must have 50,000 inhabitants or more. The area title may include, in addition to the largest city, up to two city names on the basis and in the order of the following criteria: (1) The additional city has at least 250,000 inhabitants or (2) the additional city has a population of one-third or more of that of the largest city and a minimum population of 25,000. An exception occurs where two cities have contiguous boundaries and constitute, for economic and social purposes, a single community of at least 50,000, the smaller of which must have a population of at least 15,000.

Age. The age classification is based on the age of the person at the person's last birthday.

Race. The population is divided into three groups on the basis of race: White, Black, and "other races." The last category includes Indians, Japanese, Chinese, and any other race except White and Black. In this report, "other races" are usually shown in combination with the Black population.

Persons of Spanish origin. Persons of Spanish origin in this report were determined on the basis of a question that asked for self-identification of the person's origin or descent. Respondents were asked to select their origin (or the origin of some other household member) from a "flash card" listing ethnic origins. Persons of Spanish origin, in particular, were those who indicated that their origin was Mexican, Puerto Rican, Cuban, Central or South American, or some other Spanish origin.

SOURCE AND RELIABILITY OF THE ESTIMATES

Source of data. Most of the estimates in this report are based on data obtained from the Current Population Survey (CPS) of the Bureau of the Census. Some data, as footnoted in the tables, were obtained from the 1970 Census of Population. Brief descriptions of the sources from and procedures by which data were obtained are presented below.

Current population survey (CPS). The CPS estimates in this report are based on data obtained annually in March of 1960 through 1976. The monthly CPS deals mainly with labor force data for the civilian noninstitutional population. Questions relating to labor force participation are asked about each member 14 years old and older in each sample household. In addition, supplementary questions are asked each March about household and family characteristics.

The present CPS sample was initially selected from the 1970 census file and is updated continuously to reflect new construction where possible (see section, "Nonsampling variability," below). Samples for previous sample designs were selected from files from the census most recently completed at the time.

The following table provides a description of some aspects of the CPS sample designs in use during the referenced data-collection periods.

Description of the Current Population Survey

Time period	Number of sample areas[1]	Households eligible[2]		Households visited, not eligible[2]
		Interviewed	Not interviewed	
August 1972 to present.....	461	45,000	2,000	8,000
August 1971 to July 1972.....	449	45,000	2,000	8,000
January 1967 to July 1971.....	449	48,000	2,000	8,500
March 1963 to December 1966.....	357	33,500	1,500	6,000
January 1960 to February 1963....	333	33,500	1,500	6,000

[1]These areas were chosen to provide coverage in each State and the District of Columbia.

[2]These are households which were visited, but were found to be vacant or otherwise not eligible for interview.

The estimating procedure used for the monthly CPS data involves the inflation of weighted sample results to independent estimates of the civilian noninstitutional population of the United States by age, race, and sex. These independent estimates were based on statistics from decennial censuses; statistics on births, deaths, immigration, and emigration; and statistics on the strength of the Armed Forces. For estimates in this report, certain persons in the Armed Forces were also included (that is, male members of the Armed Forces who were living off post or with their families on post). The estimation procedure for the data in the report also involved a further adjustment so that husband and wife of a household received the same weight.

Decennial census of population. Decennial census data for 1970 in this report, as footnoted, are based on a 5-percent sample. Descriptions of the samples can be found in the appropriate census publications.

Reliability of the estimates. Since the CPS estimates in this report were based on a sample, they may differ somewhat from the figures that would have been obtained if a complete census had been taken using the same schedules, instructions, and enumerators. There are two types of errors possible in an estimate based on a sample survey—sampling and nonsampling. For estimates in this report, indications of the magnitude of sampling error are provided, but the extent of the nonsampling error is unknown. Consequently, particular care should be exercised in the interpretation of figures based on a relatively small number of cases or on small differences between estimates.

Nonsampling variability. As in any survey work, the results are subject to errors of response and nonreporting in addition to sampling variability. Nonsampling errors can be attributed to many sources, e.g., inability to obtain information about all cases in the sample, definitional difficulties, differences in the interpretation of questions, inability or unwillingness to provide correct information on the part of respondents, inability to recall information, mistakes made in collection such as in recording or coding the data, mistakes made in processing the data, mistakes made in estimating values for missing data, and failure to represent all units with the sample (undercoverage). The approximate magnitude of two sources of undercoverage in CPS is known and is described next.

Approximately 600,000 conventional new construction units were issued building permits prior to the 1970 census but building was not completed by the time of the census (i.e., April 1970); these units have no representation in the CPS sample. Conventional new construction, for which building permits were issued after the census, is represented. In addition to undercoverage of conventional new construction, CPS misses at least 200,000 new mobile homes. These are missed because there is no systematic sampling procedure to provide representation of mobile homes constructed since the 1970 census.

Note: These estimates of missed units are relevant to the present sample only and not to earlier designs where the extent of undercoverage was generally less.

Sampling variability. The standard errors given in the following tables are primarily measures of sampling variability, that is, of the variations that occurred by chance because a sample rather than the whole of the population was surveyed. As calculated, the standard error also partially measures the effect of certain response and enumeration errors, but it does not measure any systematic biases in the data. The chances are about 68 out of 100 that an estimate from the survey differs from a complete census figure by less than the standard error. The chances are about 90 out of 100 that this difference would be less than 1.6 times the standard error and about 95 out of 100 that the difference would be less than twice the standard error.

All statements of comparison appearing in the text are significant at a 1.6 standard error level or better, and most are significant at a level of more than 2.0 standard errors. This means that for most differences cited in the text, the estimated difference is greater than twice the standard error of the difference. Statements of comparison qualified in some way (e.g., by use of the phrase, "some evidence") have a level of significance between 1.6 and 2.0 standard errors.

Note when using small estimates. Summary measures (such as averages and percent distributions) are shown in the report only when the base of the measure is 75,000 or greater. Because of the large standard errors involved, there is little chance that summary measures would reveal useful information when computed on a smaller base. Estimated numbers are shown, however, even though the relative standard errors of these numbers are larger than those for corresponding percentages. These smaller estimates are provided primarily to permit such combinations of the categories as serve each user's need.

Standard errors for data based on the decennial census. Sampling errors on all data from the 5-percent sample of the 1970 decennial census shown in this report are small enough to be disregarded. However, the standard errors may be found in the appropriate census volumes.

Standard errors for data based on the CPS. Standard error tables and their use. Instead of providing individual standard errors for each characteristic of interest, generalized standard errors are provided for each set of characteristics which have nearly equal standard errors to conserve space. As a result, an indication of the order of magnitude of the standard errors is provided rather than the precise standard error for any specific item.

Table A-1. Standard Errors of Estimated Numbers

(68 chances out of 100. Numbers in thousands)

Size of estimate	Standard error	Size of estimate	Standard error
25.....	10	5,000.....	144
50.....	15	10,000....	201
100.....	21	15,000....	243
250.....	33	25,000....	306
500.....	46	50,000....	403
1,000.....	65	100,000...	475
2,500.....	103		

Note: For a particular characteristic see table A.3 for the appropriate factor to apply to the above standard errors.

The figures presented in tables A-1 and A-2 provide approximations to standard errors of estimated numbers and estimated percentages. Standard errors for intermediate values not shown may be approximated by interpolation. Estimated standard errors for specific characteristics cannot be obtained from tables A-1or A-2 without the use of the factors in table A-3. These factors must be applied to the standard errors in order to adjust for the combined effect of sample design and estimating procedure on the value of the characteristic. The determination of the proper factor for a percentage depends upon the subject matter of the numerator of the percentage, not the denominator. Also, the factors for all household members should be used for characteristics pertaining to all persons in a household. For characteristics which include only some household members, such as "children under 18 years of age," the factor for some household members should be used.

Illustration of the use of tables of standard errors. Table C of this report shows there were 7,489,000 Black households in 1976. Table A-1 shows the standard error on an estimate of this size to be approximately 172,000. Applying the appropriate factor from table A-3, the approximate standard error is 0.5 x 172,000 = 86,000. The chances are 68 out of 100 that the estimate would have been a figure differing from a complete census figure by less than 86,000. The chances are 95 out of 100 that the estimate would have differed from a complete census figure by less than 172,000 (twice the standard error).

Of these 7,489,000 Black households, 1,961,000, or 26.2 percent, were female family heads with no husband present. Table A-2 shows the standard error of 26.2 percent on a base of 7,489,000 to be approximately 1.1 percentage points. Table A-3 shows the factor for Black household-and-family characteristics to be 0.5. Multiplying the factor of 0.5 times the standard error of 1.1 results in a standard error of approximately 0.6 percentage points. Consequently, chances are 68 out of 100 that the estimated 26.2 percent would be within 0.6 percentage points of a complete census figure; chances are 95 out of 100 that the estimate would be within 1.2 percentage points of a complete census figure, i.e., the 95 percent confidence interval would be from 25.0 to 27.4 percent.

Standard error of a difference. For a difference between two sample estimates, the standard error is approximately equal to

$$\sigma_{(x-y)} \doteq \sqrt{\sigma_x^2 + \sigma_y^2} \qquad (1)$$

where σ_x and σ_y are the standard errors of the estimates x and y; the estimates can be of numbers, percents, averages, etc. This will represent the actual standard error quite accurately for the difference between two estimates of the same characteristic in two different areas, or for the difference between separate and uncorrelated characteristics in the same area. If, however, there is a high positive correlation between the two characteristics, the formula will overestimate the true standard error.

Table A-2. Standard Errors of Estimated Percentages

(68 chances out of 100)

Base of estimated percentage (thousands)	Estimated percentage					
	1 or 99	2 or 98	5 or 95	10 or 90	25 or 75	50
100	2.1	2.9	4.5	6.2	8.9	10.3
250	1.3	1.8	2.8	3.9	5.6	6.5
500	0.9	1.3	2.0	2.8	4.0	4.6
1,000	0.6	0.9	1.4	2.0	2.8	3.3
2,500	0.4	0.6	0.9	1.2	1.8	2.1
5,000	0.3	0.4	0.6	0.9	1.2	1.5
10,000	0.2	0.3	0.4	0.6	0.9	1.0
15,000	0.2	0.2	0.4	0.5	0.7	0.8
25,000	0.13	0.2	0.3	0.4	0.6	0.7
50,000	0.09	0.13	0.2	0.3	0.4	0.5
100,000	0.06	0.09	0.14	0.2	0.3	0.3

Note: For a particular characteristic see table A.3 for the appropriate factor to apply to the above standard errors.

Illustration of the computation of the standard error of a difference between estimated percentages. Table C of this report shows that in 1970 there were 1,358,000 or 21.8 percent Black family households that were headed by women with no husband present. Thus, the apparent difference between the percent of Black family households headed by women with no husband present in 1970 and in 1976 is 4.4 percent. The standard error (σ_x) of 26.2 percent on a base of 7,489,000 is 0.6 percentage points, as shown above. Table A-2 and factor table A-3 show the standard error (σ_y) of 21.8 percent with a base of 6,223,000 to be approximately 0.5 percentage points. Therefore, using formula (1), the standard error of the estimated difference of 4.4 percent is about

$$0.8 \doteq \sqrt{(0.6)^2 + (0.5)^2} \ .$$

This means the chances are 68 out of 100 that the estimated difference based on the sample estimates would vary from the difference derived using complete census figures by less than 0.8 percent. The 68 percent confidence interval around the 4.4 percent difference is from 3.6 to 5.2, i.e., 4.4 ± 0.8. A conclusion that the average estimate of the difference derived from all possible samples of the same size and design lies within a range computed in this way would be correct for roughly 68 percent of all possible samples. The 95-percent confidence interval is from 2.8 to 6.0. Thus, we can conclude with 95 percent confidence that the percent of female-headed Black family households with no husband present in 1976 is actually greater than the percent in 1970.

Standard error of a ratio. All average values for persons in families or households shown in the tables of this report were calculated as the ratio of two numbers. For example, the average number of persons per family is calculated as

$$\frac{x}{y} = \frac{\text{total number of persons in families}}{\text{total number of families}}$$

The denominator, y, of the ratio always represents a count of households or families of a certain class. The numerator, x, represents a count of persons with the characteristic under consideration who are members of these households or families; this count may be 0, 1, 2, 3, or more. Standard errors for these averages may be approximated using the following formula:

$$\sigma_{\frac{x}{y}} = \left(\frac{x}{y}\right)\left(\frac{\sigma_x}{x}\right) = \frac{\sigma_x}{y} \ .$$

Table A-3. Factors to be Applied to Tables A-1 and A-2 to Estimate Standard Errors of Persons and Families

(For meaning of symbols, see text)

Characteristic	CPS data collected January 1967 to present[1]								
	Persons						Families, households, heads of households, primary and unrelated individuals		
	Some household members and secondary individuals			All household members					
	Total or White	Black	Spanish origin	Total or White	Black	Spanish origin	Total or White	Black	Spanish origin
Total, United States or Nonfarm.....									
Household and family[2].....	0.9	1.1	1.0	1.0	1.3	1.4	0.6	0.5	0.6
Residence: metropolitan and nonmetropolitan.....	(X)	(X)	(X)	1.0	1.3	1.4	0.7	0.8	0.6
Education, tenure, employment status, and occupation[2].....	(X)	(X)	(X)	(X)	(X)	(X)	0.6	0.5	0.6
FARM									
Household and family[2].....	1.2	1.4	1.4	1.3	1.8	1.9	0.8	0.8	0.8

[1]To estimate standard errors for the period 1960 to 1966, multiply the above factor by 1.2.
[2]For metropolitan-nonmetropolitan data cross-tabulated with this characteristic, multiply the factor of interest in this row by 1.4.

The standard error of the estimated number of persons, σ_x, may be approximated using the standard error table and the factor table as explained above.

Standard errors of estimated medians. The sampling variability of an estimated median depends upon the form of the distribution as well as the size of its base. An approximate method for measuring the reliability of a median is to determine an interval about the estimated median such that there is a stated degree of confidence that the median based on a complete census lies within the interval. The following procedure may be used to estimate the 68-percent confidence limits of a median based on sample data.

(1) Determine, using the standard error tables and factors, the standard error of a 50 percent characteristic;

(2) add to and subtract from 50 percent the standard error determined in step (1);

(3) using the distribution of the characteristic, calculate the confidence interval corresponding to the two points established in step (2).

A two-standard-error confidence interval may be determined by finding the values corresponding to 50 percent plus and minus twice the standard error determined in step (1).

Illustration of the computation of the standard error of a median. Table G shows that the median age in 1976 of female family heads with no husband present was 42.7 years. Table G also indicates the base of the distribution from which this median was determined is 7,482,000 female family heads.

1. Table A-2 shows that the standard error of 50 percent on a base of 7,482,000 is about 1.3 percent. Multiplying 1.3 percent times the factor of 0.6 in table A-3, the standard error becomes 0.8 percent.

2. To obtain a 95-percent confidence interval on the estimated median, add to and subtract from 50 percent twice the standard error in step (1). This yields percent limits of 48.4 and 51.6.

3. From table G it can be determined that 33.5 percent were under 35 years of age and 21.4 were between 35 and 44 years of age. By linear interpolation, the lower limit on the estimate is found to be about

$$34.9 + (10)\left(\frac{48.4 - 33.5}{21.4}\right) = 41.9.$$

Similarly, the upper limit may be found by linear interpolation to be about

$$34.9 + (10)\left(\frac{51.6 - 33.5}{21.4}\right) = 43.4.$$

Thus, the 95-percent confidence interval ranges from 41.9 to 43.4 years.
